# **Introduction to Python: Basics #1**

# Introduction to Python - Basics #1

Python is a high-level, beginner-friendly programming language used in robotics, automation, game development, and artificial intelligence. It is known for its **simple and readable syntax**, making it a great first language for learning programming.

# 1. Printing Output in Python

One of the first things you'll do in Python is **display text on the screen** using the print() function.

```
print("Hello, World!")
```

#### **Output:**

Hello, World!

- print() is used to **display messages** in Python.
- Text must be inside quotation marks (" " or ' ').

• Every statement in Python runs from top to bottom.

#### 2. Taking User Input

Python allows users to **enter data** using the <code>input()</code> function:

```
name = input("Enter your name: ")
print("Hello, " + name + "!")
```

**Example Output:** If the user types Hannah, the output will be:

```
Hello, Hannah!
```

- The input() function takes user input as a string.
- We can use + to concatenate (join) text together.

### 3. Variables and Data Types

In Python, a **variable** is used to store values, such as numbers or text:

```
age = 15
height = 5.7
name = "Hannah"
```

### **Common Data Types:**

- int → Whole numbers (e.g., 10, 25, 42).
- float → Decimal numbers (e.g., 3.14, 7.89).
- $str \rightarrow Text$  (e.g., "Hello", "Python").
- boo1 → True/False values (e.g., True, False).

## 4. Type Conversion

When using input(), Python always treats the input as a **string**. To use numbers, we need to **convert the type**:

```
age = input("Enter your age: ") # Input is stored as a string
age = int(age) # Convert to integer
print("Next year, you will be " + str(age + 1) + " years old!")
```

- int() → Converts a string to an integer.
- float() → Converts a string to a decimal number.
- str() → Converts numbers back to text.

Now that you've learned the basics, try answering the questions below!

1. What will the following code output?

print("Hello, World!")

- A. Hello, World!
- O B. hello world
- C. "Hello, World!"
- D. An error

Submit

Correct! Well done!

- 2. Which function allows a user to enter input in Python?
- A. print()
- B. input()
- C. get()
- D. scan()

Submit

Correct! Well done!

3. Wh	ch of the	following	correctly	stores	user input	in a	variable?
-------	-----------	-----------	-----------	--------	------------	------	-----------

- A. name = input()
- B. input(name)
- C. name == input()
- D. print(input(name))

Submit

## **✓** Correct! Well done!

4. What will the following code output?

name = "Alex"
print(name)

- A. Alex
- B. "name"
- C. name
- O. Nothing

Submit

**✓** Correct! Well done!

- 5. What data type is stored in the variable `user\_age`?
- A. int
- B. float
- C. string
- O. boolean

Submit

**✓** Correct! Well done!

J. Trilat by	mbol is used for writing comments in Python?
○ A. //	
B. #	
○ C.	
○ D. **	
Submit	
✓ Correct	ct! Well done!
7. Which c	of the following is a valid variable name in Python?
	ame
<ul><li>B. first_</li></ul>	
O. first-	
O D. print	
Submit	
Correct	ct! Well done!
8. How do	you convert user input to an integer in Python?
○ A. str(in	put())
<ul><li>A. str(in</li><li>B. int(in</li></ul>	nput())
<ul><li>A. str(in</li><li>B. int(in</li><li>C. input</li></ul>	aput()) aput()) t(int)
<ul><li>A. str(in</li><li>B. int(in</li><li>C. input</li><li>D. input</li></ul>	aput()) aput()) t(int)
<ul><li>A. str(in</li><li>B. int(in</li><li>C. input</li></ul>	aput()) aput()) t(int)
<ul><li>A. str(in</li><li>B. int(in</li><li>C. input</li><li>D. input</li></ul>	aput()) aput()) t(int)
<ul><li>A. str(in</li><li>B. int(in</li><li>C. input</li><li>D. input</li></ul>	aput()) aput()) t(int)
<ul><li>A. str(in</li><li>B. int(in</li><li>C. input</li><li>D. input</li></ul>	aput()) aput()) t(int)
<ul><li>A. str(in</li><li>B. int(in</li><li>C. input</li><li>D. input</li><li>Submit</li></ul>	aput()) aput()) t(int)
<ul><li>A. str(in</li><li>B. int(in</li><li>C. input</li><li>D. input</li><li>Submit</li></ul>	appens if you try to add an integer and a string in Python?
<ul> <li>A. str(in</li> <li>B. int(in</li> <li>C. input</li> <li>D. input</li> <li>Submit</li> </ul> 9. What ha <ul> <li>A. The in</li> </ul>	iput()) iput()) t(int) t().int()

04/03/2025, 13:	Introduction to Python: Basics #1
	D. The string and number will be printed together.
	Submit
1	0. What will happen if you forget parentheses in `print "Hello"`?
	A. It will print "Hello" correctly.
	B. It will print `Hello` without quotes.
	C. It will cause a syntax error.
	D. It will automatically correct the mistake.
	Submit
